Introduction

- Honey is a natural sweet substance produced by bees and processed into a food product with antibacterial, antioxidant, antimutagenic, and anti-inflammatory properties
- Adulteration with sugar syrups:
 - Negatively impacts nutritional value, and food safety
 - Results in financial losses for the apiculture sector.
- Major royal jelly protein 1
 - Bee-derived protein
 - Potential honey authenticity marker

AIM: The development of a rapid assay for honey authenticity assessment.

- **Competitive lateral flow immunoassay for the detection of major royal jelly protein 1.**

Results

Conclusions

simplicity, in-field application by non-expert users, with no instrumentation required
